COMPLETE SPECIFICATION

Vaginal Douche Composition

We, TAMPAX INCORPORATED, a corporation of the State of Delaware, United States of America, of Three Rivers, Palmer, Massachusetts, United States of America, do hereby declare the invention, for which we pray that a patent may be granted to us, and the method by which it is to be performed, to be particularly described in and by the follow-

10 ing statement:—

This invention relates to compositions adapted to be used for treating the surfaces of the mucous membranes of the human body and more particularly to 15 compositions that may be advantageously incorporated in or used as a vaginal douche. The present compositions may be solids adapted to be dissolved in water to form a douche, or relatively concentrated 20 solutions that must be diluted before use, or solutions that are sufficiently dilute so that they may be used without further dilution

dilution.

It is desirable that a douche for general douching purposes should have an effective cleansing action on the vaginal surfaces, that it be mildly astringent, and that it should have an acidity approximating that of the normal vagina, i.e., a pm 30 between 3.0 and 6.0 and preferably between 4.0 to 5.0. An alkaline douche is objectionable in that it interferes with the natural reaction of the vaginal tract and disturbs the development of a normal 35 bacterial flora which is generally considered essential to the maintenance of a healthy condition. Hence it is important that the composition used in preparing the douche be capable of establishing and 40 maintaining a desired acidity of the douche solution. Also it is important that the douche solution be free from com-

ponents which would destroy, for example, the so-called Doderlein bacilli which are normally and desirably present in the vagina. It is also desirable that the components be non-toxic and free from

irritating and other deleterious properties and that they be chemically and physically stable so that the composition may 50 be stored over a relatively long period of time without deteriorating

time without deteriorating.

It is accordingly an object of the present invention to provide a mildly acid, mildly astringent and effectively detergent solution for treating exposed or readily accessible mucous membrane surfaces. It is another object of the invention to provide a solid composition that is adapted to be dissolved in a suitable medium such as water to form a solution of this type that is especially adapted to be used as a douche for cleansing vaginal surfaces. It is still another object of the invention to provide a dry, finely divided solid composition of this character that when dissolved in water forms a clear solution and is capable of establishing and maintaining a desired acidity, i.e., a ph of the order of 4.0 to 5.0. It is a further object of the invention to provide a douche solution of this type that is free from components which would destroy the Doderlein bacilli normally present in the vagina. It is a still further object of the invention to provide a douche that is non-toxic, completely free from irritating and deleterious components and that has a beneficial effect on vaginal surfaces with which it comes in contact. Other objects of the invention will be in part obvious and in part pointed out hereafter.

We have found that the objects of the present invention may be achieved in general by providing a composition comprising a non-toxic, water-soluble astringent selected from the group consisting of aluminum and zinc salts and a wetting agent that is compatible with the astringent in water solution. Although certain of the salts of metals other than zinc and aluminum exhibit an astringent action, it has been found that the zinc and aluminum and more particularly the sulfates of

فيجور

these metals have an astringent action that is especially favourable in compositions of the present type. In order to provide an effective cleansing action, we prese fer to use a wetting agent, i.e., one of the so-called "soapless detergents" as distinguished from an ordinary soap. While soaps are effective cleansing agents for this purpose, they are objectionable in that 10 they are normally alkaline and hence tend to alter the normally acid condition of the vagina. Moreover, they lose their effectiveness when incorporated in acid solution and are incompatible with solutions of zinc and aluminum salts, that is to say, they are precipitated by zinc and aluminum salts in acid solution.

We have found that a douche incorporating a suitable astringent and wetting 20 agent as described hereafter, provides an unusually effective cleansing of the vaginal surfaces. Such surfaces normally have a mucous layer which is substantially impermeable to most aqueous solutions. The astringent of the present douche operates to coagulate or clot this mucous layer thus permitting the wetting agent to reach and cleanse the underlying surfaces. Hence the astringent and wetation that cannot be achieved with either component alone.

In order to prevent destruction of the Doderlein bacilli, the wetting agent 35 used in the present composition is preferably non-germicidal. The suitability of a wetting agent for use in douche compositions of the present type can be determined by subjecting the wetting agent to 40 a standard germicidal test against Staph. Aureus, as described for example in "U.S. Food and Drug Administration

Methods of Testing Antiseptics and Disinfectants" in U.S. Department of Agri-45 culture's circular No. 198 (December 1931). Wetting agents which when tested according to this procedure in aqueous solution are found to be nongermicidal against Staph. Aureus at a

germicidal against Staph. Aureus at a 50 dilution of 1:200 are suitable for use in a douche of the present type and such compounds may be termed "non-germicidal" wetting agents. We have found that a particular wetting agent, namely,

55 alkylated aryl polyether alcohol, which may be the product sold under the trade name Triton X 100, (Triton is a registered trade mark) is exceptionally useful in compositions of the type disclosed in the application in the type disclosed in

60 this application in that it may be used in relatively high concentrations without killing Doderlein bacilli. More particularly we have found that the critical killing dilution of the alkylated aryl poly-65 etheralcohol against Doderlein bacilli is

about 1:1000 as compared with 1:30000 for the sodium alkyl C_s to C_{1s} sulfoacetate and alkyl C_s to C_{1s} metosodium sulfobenzoate. Thus the alkylated aryl polyether alcohol may be used at substantially 70 high concentrations and hence the resulting solution has a substantially more effective cleansing action.

The relative proportions of astringent and wetting agent are determined in some 75 measure by the concentration desired in the douche solution when ready for use. The compatibility of the wetting agent and astringent varies somewhat according to the particular astringent and wetting 80 agents used. We have found that from this point of view zinc salts, particularly zinc sulfate, are to be preferred. Other zinc salts that may be used are the chloride and the acetate. In general, the quantity 85 of astringent should be sufficient to give the desired coagulating action and the quantity of wetting agent should be sufficient to give an effective cleansing action but should be so great as to kill the Doder- 90 lein bacilli. The solid compositions of the present invention are preferably compounded in such manner that, when they are dissolved in water to the final dilution for use as a douche, the concentra- 95 tion of astringent is between 0.06 and 0.5% by weight of the solution and the quantity of wetting agent is between 0.00016% and 0.1% by weight of the solution. The quantity of wetting agent 100 should not, of course exceed that which can be dissolved without precipitation in solution containing the astringent.

As pointed out above, it is desirable that the acidity of the solution be established 105 and maintained at a value approximating that of the normal vagina. It has been found that when aluminum sulfate, ammonium alum, or potassium alum are used as astringents the desired acidity is 110 usually produced by the aluminum salt itself, whereas when zinc salts are used it is desirable that a small quantity of an acid or acid salt be added to the composition to adjust the acidity to a pH between 115 3.0 and 6.0 and preferably to a value between 4.0 and 5.0. It has been found particularly desirable to adjust the acidity of the douche with a mixture of sodium citrate and sodium acid citrate that pro-120 vides a buffering action which maintains the pH of the douche within the desired range. The desired acidity can also be obtained by using any of various common acids such as sulfuric, acetic tartaric, 125 citric, malic or lactic acid or acid salts of these acids.

In the case of a solution that is to come in contact with a permeable membrane such as that of the vaginal surface it is 180

	001,
	desirable that the solution be approxi-
	mately isotonic or perhans somewhat
	mately isotonic or perhaps somewhat hypertonic, i.e., that it contains a suffi-
	cient quantity of sodium chloride to pro-
5	duce a solution having a concentration
_	equivalent to or somewhat greater than
	that of the blood serum. Accordingly the
	compositions of the present invention pre-
	ferably include a quantity of sodium
10	chloride such that when they are dis-
	solved in water to the desired final dilu-
	tion they contain that sodium
	chloride concentration which will make
	them at least approximately isotonic.
15	Various agents other than those pre- viously mentioned may also be included
	viously mentioned may also be included
	in the solid compositions and solutions of
	the present invention to accomplish
_	special purposes. In some cases it is desir-
20	able to add a conditioning agent such as
	lactose which favors the growth of the
	Doderlein bacilli. Also aromatic com-
	pounds such as menthol, oil of peppermint and the like may be included to
25	render the product more agreeable in use.
لامك	In order to point out more fully the
	nature of the present invention, there are
	given below certain specific examples of
•	the invention and its application in prac-
30	tical use and also certain modifications
90	tical use and also certain modifications and alternatives. However, it should be
	understood that these are not intended
	to be exhaustive or to be limiting of the
	invention On the contrary, these illus-
35	trations and the explanations herein are
	given in order to aquaint others skilled
	in the art with this invention and the prin-
	ciples thereof and a suitable manner of
	its application in practical use so that
40	others skilled in the art may be enabled to
	modify the invention and to adapt it and
	to apply it in numerous forms each as may be best suited to the requirements of a
	particular use.
45	The examples given below are of solid
TO	compositions that may be dissolved in
	compositions that may be dissolved in water to form a douche. These composi-
	tions when dissolved in water to the extent
	of 12 gms. per quart of water yield douche solutions that are substantially
50	douche solutions that are substantially
	inactive toward Doderlein bacilli. As
	indicated above the astringent content of
	the present douche solutions may vary from 0.06% to 0.5% by weight of the
	from 0.06% to 0.5% by weight of the
55	solution. However, not all of the follow-
	ing compositions can be used at all dilu-
	tions corresponding to the astringent range stated and still be inactive toward
	range stated and still be mactive toward
00	Doderlein bacilli. In order to avoid des-
60	truction of the Doderlein bacilli the
	following compositions should be used at
	dilutions such that the wetting agent concentration does not exceed about
	1:1000.
